- ▶ *system sorts*

<http://algs4.cs.princeton.edu>

# Two classic sorting algorithms: mergesort and quicksort

---

Critical components in the world's computational infrastructure.

- Full scientific understanding of their properties has enabled us to develop them into practical system sorts.
- Quicksort honored as one of top 10 algorithms of 20<sup>th</sup> century in science and engineering.

Mergesort. [last lecture]

Quicksort. [this lecture]

# Quicksort t-shirt

---

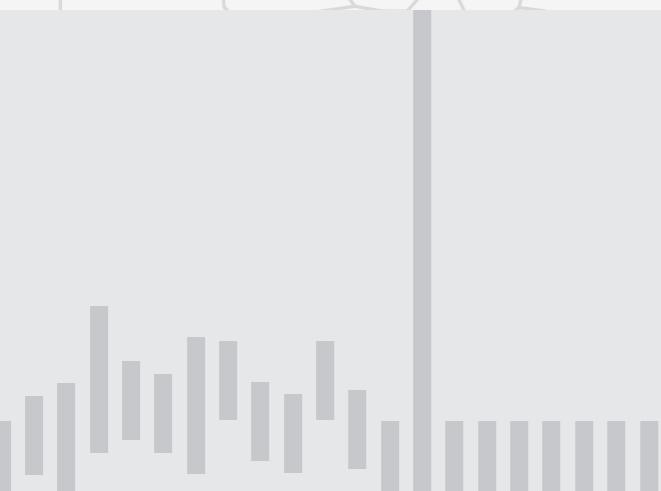

```
public static void quicksort(char[] items, int left, int right)
{
    int i, j;
    char x, y;

    i = left; j = right;
    x = items[(left + right) / 2];

    do
    {
        while ((items[i] < x) && (i < right)) i++;
        while ((x < items[j]) && (j > left)) j--;

        if (i <= j)
        {
            y = items[i];
            items[i] = items[j];
            items[j] = y;
            i++; j--;
        }
    } while (i <= j);

    if (left < j) quicksort(items, left, j);
    if (i < right) quicksort(items, i, right);
}
```

## 2.3 QUICKSORT

---

- ▶ ***quicksort***
- ▶ *selection*
- ▶ *duplicate keys*
- ▶ *system sorts*

# Quicksort

## Basic plan.

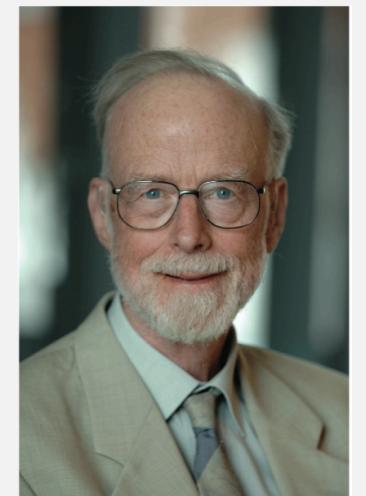

- **Shuffle** the array.
- **Partition** so that, for some j
  - entry  $a[j]$  is in place
  - no larger entry to the left of j
  - no smaller entry to the right of j
- **Sort each subarray recursively.**

<b>input</b>	Q	U	I	C	K	S	O	R	T	E	X	A	M	P	L	E
<b>shuffle</b>	K	R	A	T	E	L	E	P	U	I	M	Q	C	X	O	S
	<i>partitioning item</i>															
<b>partition</b>	E	C	A	I	E	K	L	P	U	T	M	Q	R	X	O	S
	<i>not greater</i>							<i>not less</i>								
<b>sort left</b>	A	C	E	E	I	K	L	P	U	T	M	Q	R	X	O	S
<b>sort right</b>	A	C	E	E	I	K	L	M	O	P	Q	R	S	T	U	X
<b>result</b>	A	C	E	E	I	K	L	M	O	P	Q	R	S	T	U	X

ALGORITHM 64  
QUICKSORT  
C. A. R. HOARE  
Elliott Brothers Ltd., Borehamwood, Hertfordshire, Eng.

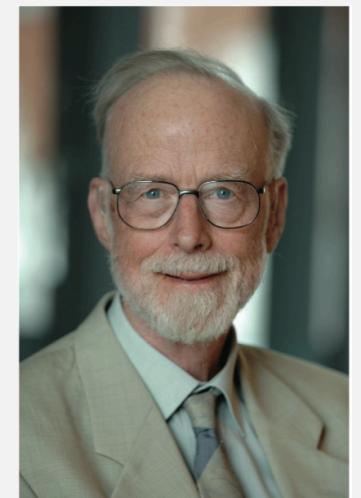

```
procedure quicksort (A,M,N); value M,N;
    array A; integer M,N;
comment Quicksort is a very fast and convenient method of
sorting an array in the random-access store of a computer. The
entire contents of the store may be sorted, since no extra space is
required. The average number of comparisons made is  $2(M-N) \ln$ 
 $(N-M)$ , and the average number of exchanges is one sixth this
amount. Suitable refinements of this method will be desirable for
its implementation on any actual computer;
begin      integer I,J;
            if M < N then begin partition (A,M,N,I,J);
                           quicksort (A,M,J);
                           quicksort (A, I, N)
                         end
end      quicksort
```

## Implementing Quicksort Programs

Robert Sedgewick  
Brown University

This paper is a practical study of how to implement the Quicksort sorting algorithm and its best variants on real computers, including how to apply various code optimization techniques. A detailed implementation combining the most effective improvements to Quicksort is given, along with a discussion of how to implement it in assembly language. Analytic results describing the performance of the programs are summarized. A variety of special situations are considered from a practical standpoint to illustrate Quicksort's wide applicability as an internal sorting method which requires negligible extra storage.

**Key Words and Phrases:** Quicksort, analysis of algorithms, code optimization, sorting

**CR Categories:** 4.0, 4.6, 5.25, 5.31, 5.5

## The Analysis of Quicksort Programs\*

Robert Sedgewick

Received January 19, 1976

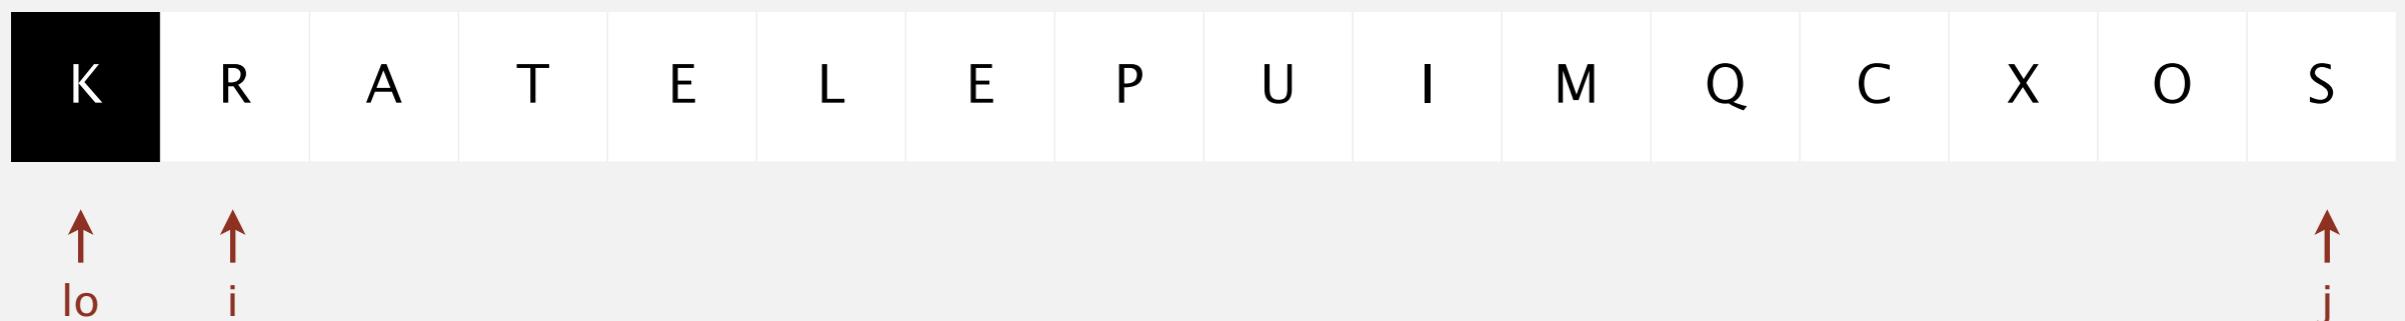

**Summary.** The Quicksort sorting algorithm and its best variants are presented and analyzed. Results are derived which make it possible to obtain exact formulas describing the total expected running time of particular implementations on real computers of Quicksort and an improvement called the median-of-three modification. Detailed analysis of the effect of an implementation technique called loop unwrapping is presented. The paper is intended not only to present results of direct practical utility, but also to illustrate the intriguing mathematics which arises in the complete analysis of this important algorithm.

# Quicksort partitioning demo

---

Repeat until  $i$  and  $j$  pointers cross.

- Scan  $i$  from left to right so long as  $(a[i] < a[lo])$ .
- Scan  $j$  from right to left so long as  $(a[j] > a[lo])$ .
- Exchange  $a[i]$  with  $a[j]$ .

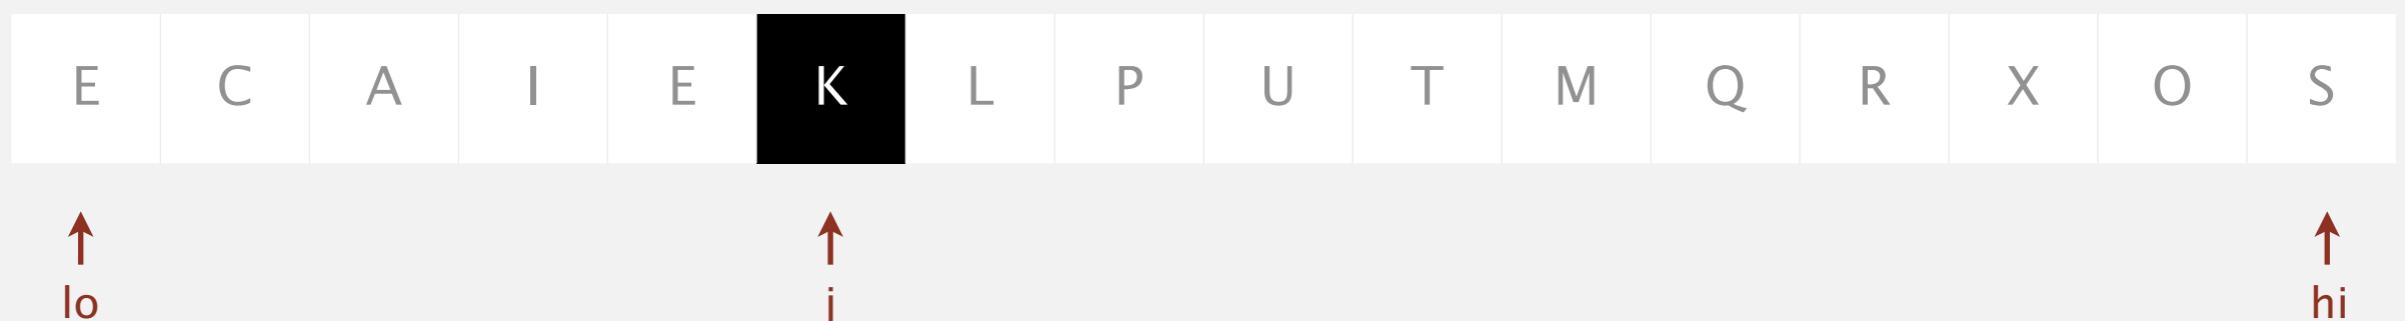

# Quicksort partitioning demo

Repeat until  $i$  and  $j$  pointers cross.

- Scan  $i$  from left to right so long as  $(a[i] < a[lo])$ .
- Scan  $j$  from right to left so long as  $(a[j] > a[lo])$ .
- Exchange  $a[i]$  with  $a[j]$ .

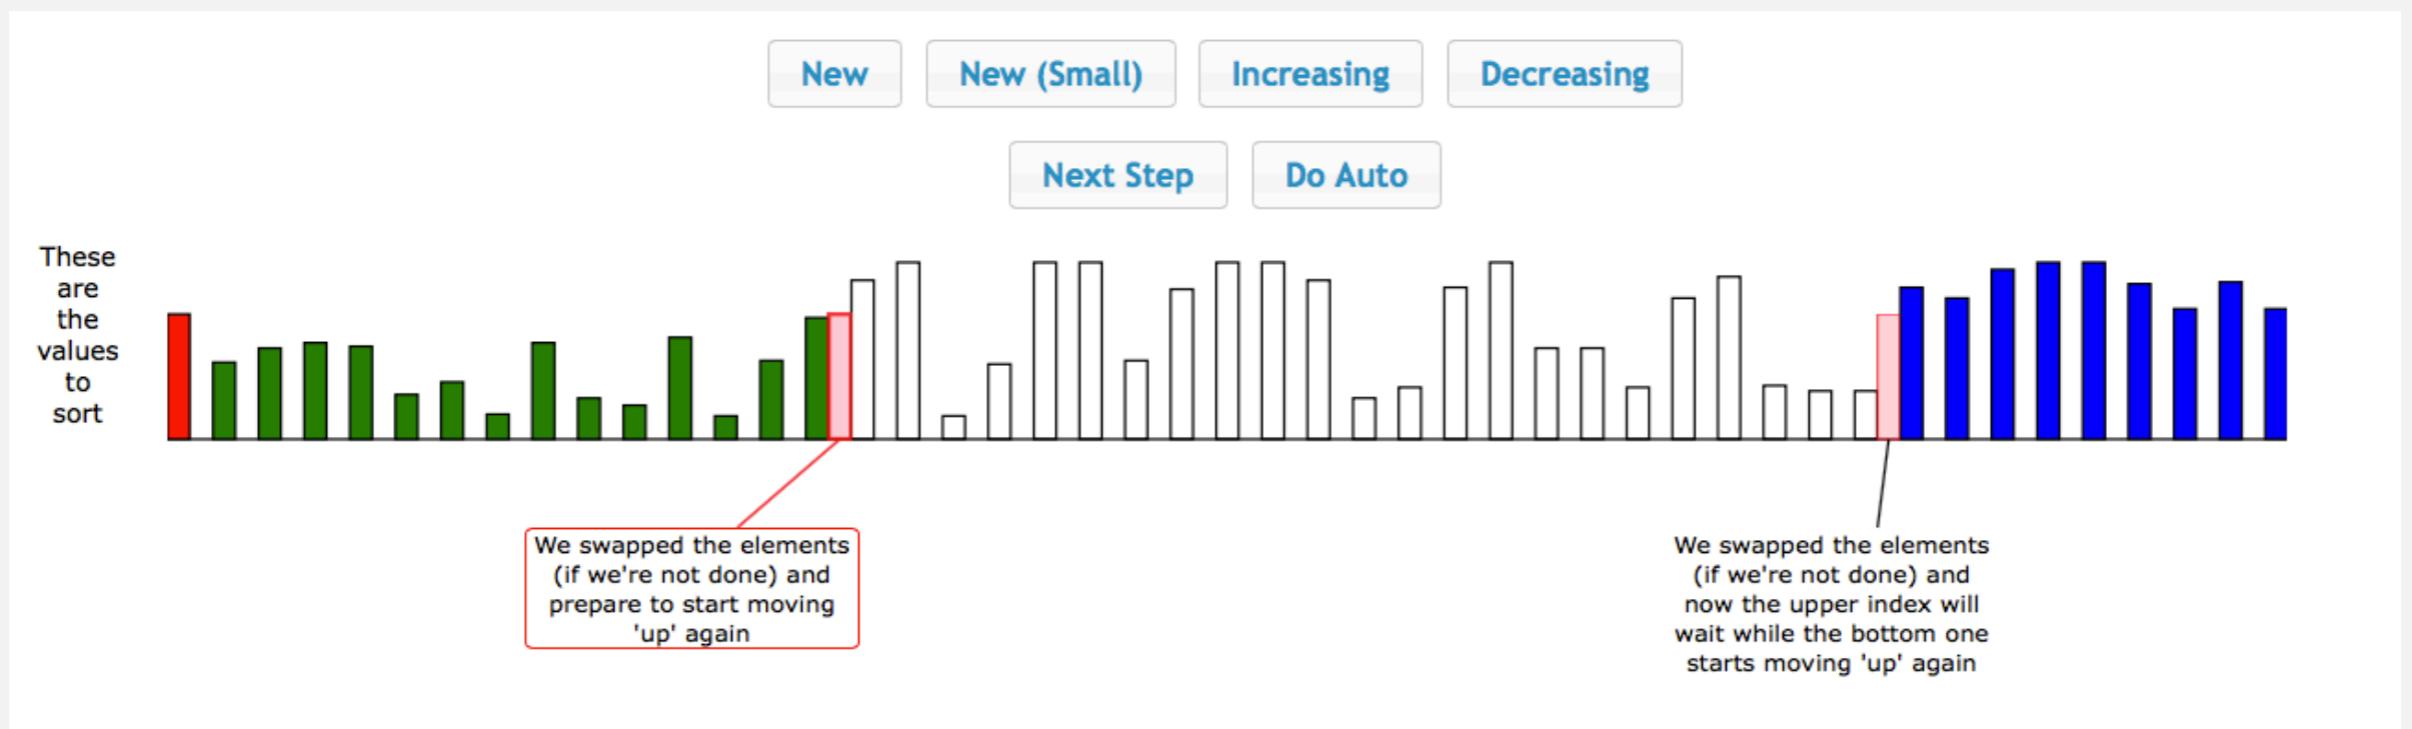

When pointers cross.

- Exchange  $a[lo]$  with  $a[j]$ .

partitioned!

# The music of quicksort partitioning (by Brad Lyon)

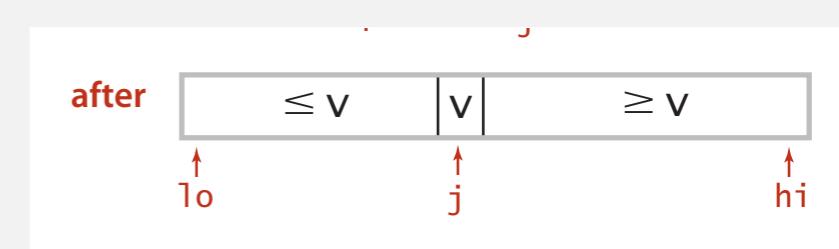

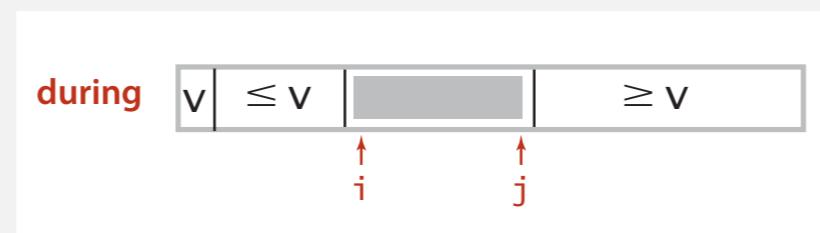

# Quicksort: Java code for partitioning

```
private static int partition(Comparable[] a, int lo, int hi)
{
    int i = lo, j = hi+1;
    while (true)
    {
        while (less(a[++i], a[lo]))           find item on left to swap
            if (i == hi) break;

        while (less(a[lo], a[--j]))           find item on right to swap
            if (j == lo) break;

        if (i >= j) break;                  check if pointers cross
        exch(a, i, j);                   swap
    }

    exch(a, lo, j);                  swap with partitioning item
    return j;                        return index of item now known to be in place
}
```

## Quicksort quiz 1

---

Q. How many compares (in the worst case) to partition an array of length  $N$ ?

- A.  $\sim \frac{1}{4} N$
- B.  $\sim \frac{1}{2} N$
- C.  $\sim N$
- D.  $\sim N \lg N$
- E. *I don't know.*

# Quicksort: Java implementation

```
public class Quick
{
    private static int partition(Comparable[] a, int lo, int hi)
    { /* see previous slide */ }

    public static void sort(Comparable[] a)
    {
        StdRandom.shuffle(a);
        sort(a, 0, a.length - 1);
    }

    private static void sort(Comparable[] a, int lo, int hi)
    {
        if (hi <= lo) return;
        int j = partition(a, lo, hi);
        sort(a, lo, j-1);
        sort(a, j+1, hi);
    }
}
```

shuffle needed for  
performance guarantee

Quicksort trace (array contents after each partition)

# Quicksort animation

---

50 random items

<http://www.sorting-algorithms.com/quick-sort>

## Quicksort: implementation details

---

**Partitioning in-place.** Using an extra array makes partitioning easier (and stable), but is not worth the cost.

**Terminating the loop.** Testing whether the pointers cross is trickier than it might seem.

**Equal keys.** When duplicates are present, it is (counter-intuitively) better to stop scans on keys equal to the partitioning item's key. ← stay tuned

**Preserving randomness.** Shuffling is needed for performance guarantee.

**Equivalent alternative.** Pick a random partitioning item in each subarray.

# Quicksort: empirical analysis (1961)

## Running time estimates:

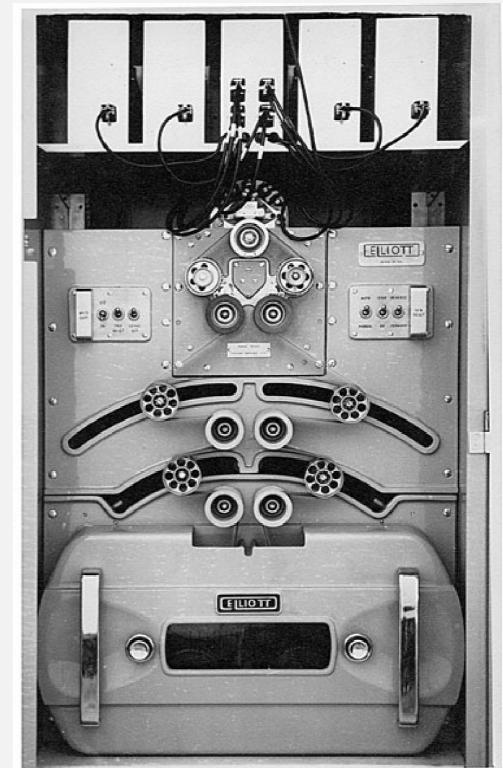

- Algol 60 implementation.
- National-Elliott 405 computer.

**Table 1**

NUMBER OF ITEMS	MERGE SORT	QUICKSORT
500	2 min 8 sec	1 min 21 sec
1,000	4 min 48 sec	3 min 8 sec
1,500	8 min 15 sec*	5 min 6 sec
2,000	11 min 0 sec*	6 min 47 sec

\* These figures were computed by formula, since they cannot be achieved on the 405 owing to limited store size.

sorting N 6-word items with 1-word keys

**Elliott 405 magnetic disc  
(16K words)**

# Quicksort: empirical analysis

---

## Running time estimates:

- Home PC executes  $10^8$  compares/second.
- Supercomputer executes  $10^{12}$  compares/second.

	insertion sort ( $N^2$ )			mergesort ( $N \log N$ )			quicksort ( $N \log N$ )		
computer	thousand	million	billion	thousand	million	billion	thousand	million	billion
home	instant	2.8 hours	317 years	instant	1 second	18 min	instant	0.6 sec	12 min
super	instant	1 second	1 week	instant	instant	instant	instant	instant	instant

Lesson 1. Good algorithms are better than supercomputers.

Lesson 2. Great algorithms are better than good ones.

# Quicksort: best-case analysis

Best case. Number of compares is  $\sim N \lg N$ .

			A	B	C	D	E	F	G	H	I	J	K	L	M	N	O

## Quicksort: average-case analysis

---

**Proposition.** The average number of compares  $C_N$  to quicksort an array of  $N$  distinct keys is  $\sim 2N \ln N$  (and the number of exchanges is  $\sim \frac{1}{3} N \ln N$ ).

**Pf.**  $C_N$  satisfies the recurrence  $C_0 = C_1 = 0$  and for  $N \geq 2$ :

$$C_N = (N+1) + \left( \frac{C_0 + C_{N-1}}{N} \right) + \left( \frac{C_1 + C_{N-2}}{N} \right) + \dots + \left( \frac{C_{N-1} + C_0}{N} \right)$$

partitioning                      left      right  
                                        ↓            ↓  
   ↑

partitioning probability

- Multiply both sides by  $N$  and collect terms:

$$NC_N = N(N+1) + 2(C_0 + C_1 + \dots + C_{N-1})$$

- Subtract from this equation the same equation for  $N-1$ :

$$NC_N - (N-1)C_{N-1} = 2N + 2C_{N-1}$$

- Rearrange terms and divide by  $N(N+1)$ :

$$\frac{C_N}{N+1} = \frac{C_{N-1}}{N} + \frac{2}{N+1}$$

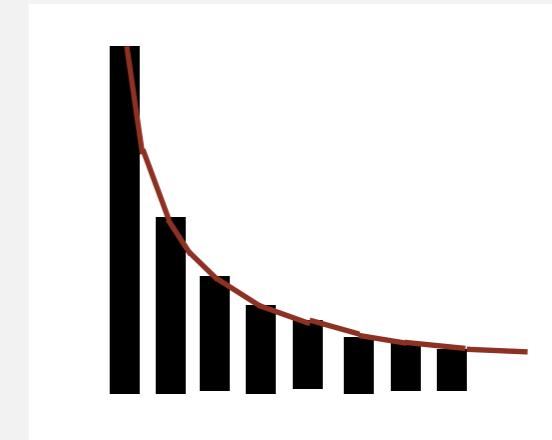

## Quicksort: average-case analysis

- Repeatedly apply previous equation:

$$\begin{aligned}\frac{C_N}{N+1} &= \frac{C_{N-1}}{N} + \frac{2}{N+1} \\ &= \frac{C_{N-2}}{N-1} + \frac{2}{N} + \frac{2}{N+1} \quad \leftarrow \text{substitute previous equation} \\ &= \frac{C_{N-3}}{N-2} + \frac{2}{N-1} + \frac{2}{N} + \frac{2}{N+1} \\ &= \frac{2}{3} + \frac{2}{4} + \frac{2}{5} + \dots + \frac{2}{N+1}\end{aligned}$$

- Approximate sum by an integral:

$$\begin{aligned}C_N &= 2(N+1) \left( \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \dots + \frac{1}{N+1} \right) \\ &\sim 2(N+1) \int_3^{N+1} \frac{1}{x} dx\end{aligned}$$

- Finally, the desired result:

$$C_N \sim 2(N+1) \ln N \approx 1.39N \lg N$$

## Quicksort: summary of performance characteristics

---

Quicksort is a (Las Vegas) randomized algorithm.

- Guaranteed to be correct.
- Running time depends on random shuffle.

Average case. Expected number of compares is  $\sim 1.39 N \lg N$ .

- 39% more compares than mergesort.
- Faster than mergesort in practice because of less data movement.

Best case. Number of compares is  $\sim N \lg N$ .

Worst case. Number of compares is  $\sim \frac{1}{2} N^2$ .

[ but more likely that lightning bolt strikes computer during execution ]

# Quicksort properties

Proposition. Quicksort is an **in-place** sorting algorithm.

Pf.

- Partitioning: constant extra space.
- Depth of recursion: logarithmic extra space (with high probability).

can guarantee logarithmic depth by recurring  
on smaller subarray before larger subarray  
(requires using an explicit stack)

Proposition. Quicksort is **not stable**.

Pf. [ by counterexample ]

i	j	0	1	2	3
		B <sub>1</sub>	C <sub>1</sub>	C <sub>2</sub>	A <sub>1</sub>
1	3	B <sub>1</sub>	C <sub>1</sub>	C <sub>2</sub>	A <sub>1</sub>
1	3	B <sub>1</sub>	A <sub>1</sub>	C <sub>2</sub>	C <sub>1</sub>
0	1	A <sub>1</sub>	B <sub>1</sub>	C <sub>2</sub>	C <sub>1</sub>

# Quicksort: practical improvements

---

## Insertion sort small subarrays.

- Even quicksort has too much overhead for tiny subarrays.
- Cutoff to insertion sort for  $\approx 10$  items.

```
private static void sort(Comparable[] a, int lo, int hi)
{
    if (hi <= lo + CUTOFF - 1)
    {
        Insertion.sort(a, lo, hi);
        return;
    }
    int j = partition(a, lo, hi);
    sort(a, lo, j-1);
    sort(a, j+1, hi);
}
```

# Quicksort: practical improvements

---

## Median of sample.

- Best choice of pivot item = median.
- Estimate true median by taking median of sample.
- Median-of-3 (random) items.

~  $12/7 N \ln N$  compares (14% fewer)  
~  $12/35 N \ln N$  exchanges (3% more)

```
private static void sort(Comparable[] a, int lo, int hi)
{
    if (hi <= lo) return;

    int median = medianOf3(a, lo, lo + (hi - lo)/2, hi);
    swap(a, lo, median);

    int j = partition(a, lo, hi);
    sort(a, lo, j-1);
    sort(a, j+1, hi);
}
```

# Algorithms

<http://algs4.cs.princeton.edu>

## 2.3 QUICKSORT

---

- ▶ *quicksort*
- ▶ *selection*
- ▶ *duplicate keys*
- ▶ *system sorts*

# Selection

---

**Goal.** Given an array of  $N$  items, find the  $k^{\text{th}}$  smallest item.

**Ex.** Min ( $k = 0$ ), max ( $k = N - 1$ ), median ( $k = N/2$ ).

## Applications.

- Order statistics.
- Find the "top  $k$ ."

## Use theory as a guide.

- Easy  $N \log N$  upper bound. How?
- Easy  $N$  upper bound for  $k = 1, 2, 3$ . How?
- Easy  $N$  lower bound. Why?

## Which is true?

- $N \log N$  lower bound?  is selection as hard as sorting?
- $N$  upper bound?  is there a linear-time algorithm?

# Quick-select

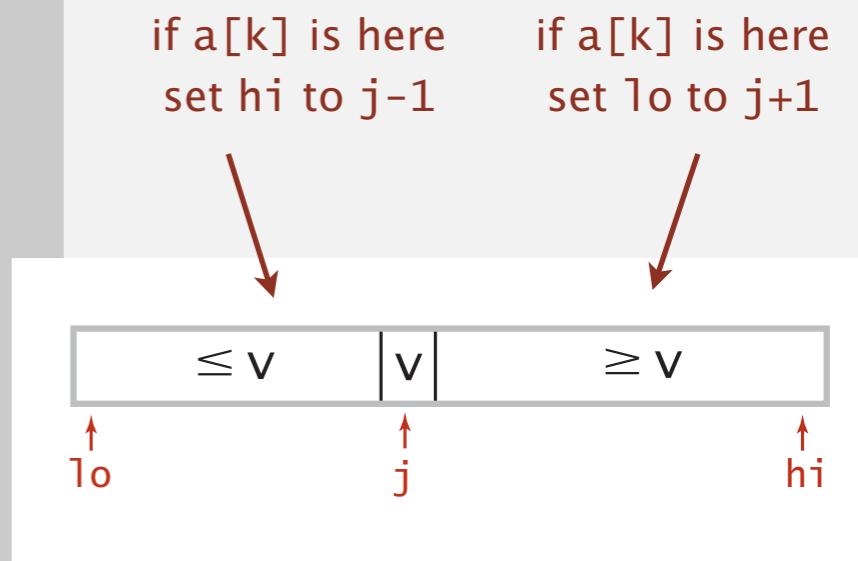

Partition array so that:

- Entry  $a[j]$  is in place.
- No larger entry to the left of  $j$ .
- No smaller entry to the right of  $j$ .

Repeat in **one** subarray, depending on  $j$ ; finished when  $j$  equals  $k$ .

```
public static Comparable select(Comparable[] a, int k)
{
    StdRandom.shuffle(a);
    int lo = 0, hi = a.length - 1;
    while (hi > lo)
    {
        int j = partition(a, lo, hi);
        if      (j < k) lo = j + 1;
        else if (j > k) hi = j - 1;
        else            return a[k];
    }
    return a[k];
}
```

## Quick-select: mathematical analysis

---

Proposition. Quick-select takes **linear** time on average.

Pf sketch.

- Intuitively, each partitioning step splits array approximately in half:  
 $N + N/2 + N/4 + \dots + 1 \sim 2N$  compares.
- Formal analysis similar to quicksort analysis yields:

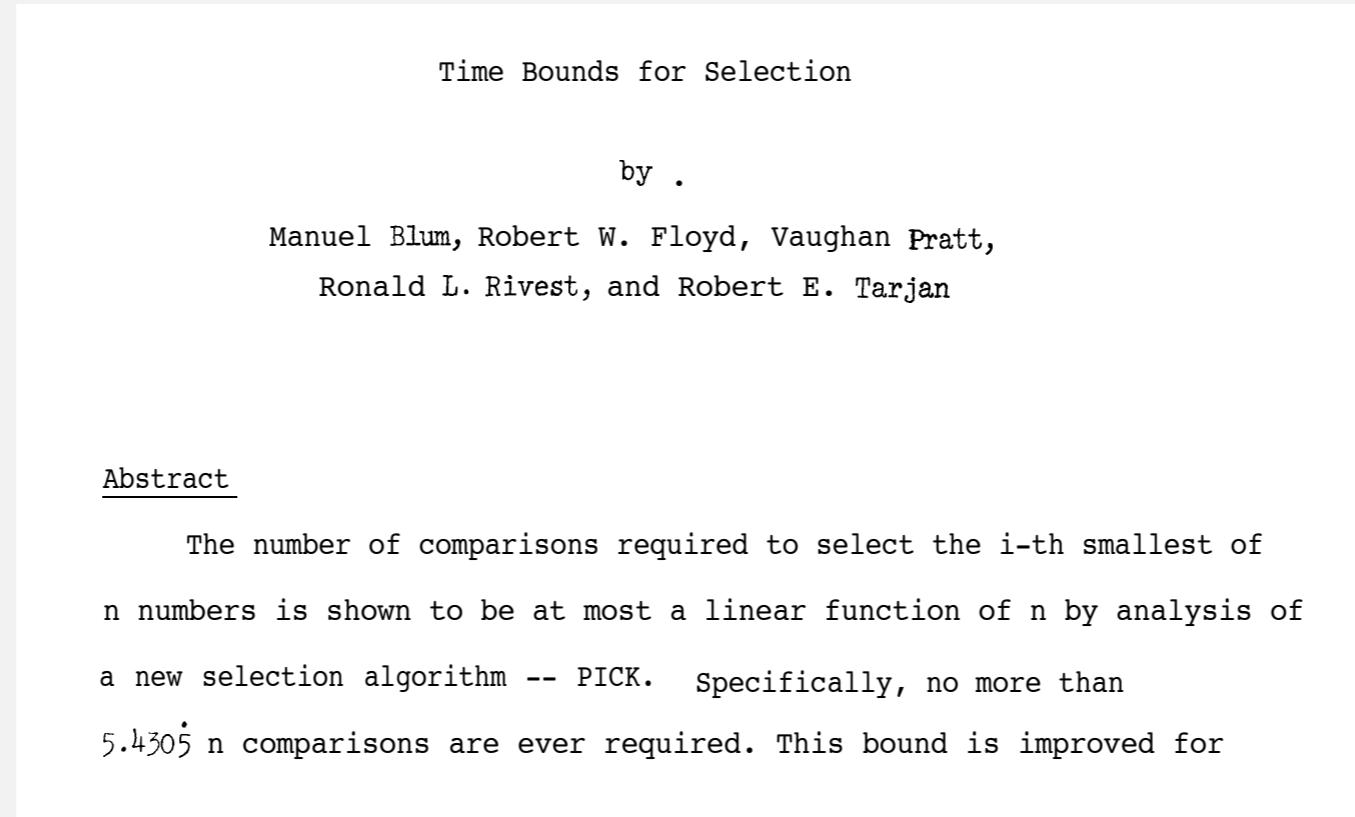

$$C_N = 2N + 2k \ln(N/k) + 2(N-k) \ln(N/(N-k))$$

- Ex:  $(2 + 2 \ln 2)N \approx 3.38N$  compares to find median  $k=N/2$ .

# Theoretical context for selection

---

**Proposition.** [Blum, Floyd, Pratt, Rivest, Tarjan, 1973] Compare-based selection algorithm whose worst-case running time is linear.

**Remark.** Constants are high  $\Rightarrow$  not used in practice.

Use theory as a guide.

- Still worthwhile to seek **practical** linear-time (worst-case) algorithm.
- Until one is discovered, use quick-select if you don't need a full sort.

- ▶ *system sorts*

# Duplicate keys

---

Often, purpose of sort is to bring items with equal keys together.

- Sort population by age.
- Remove duplicates from mailing list.
- Sort job applicants by college attended.

Typical characteristics of such applications.

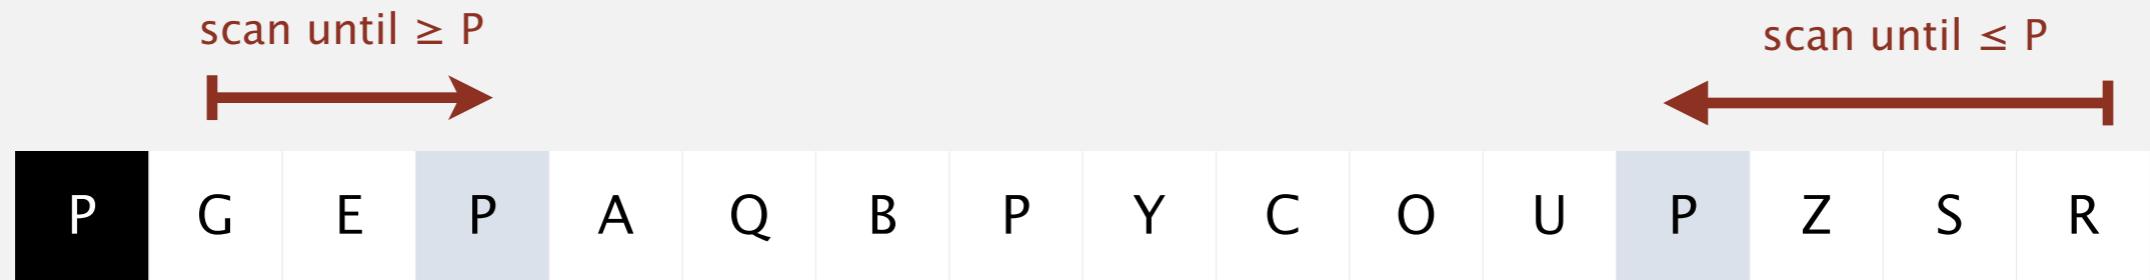

- Huge array.
- Small number of key values.

# Duplicate keys: stop on equal keys

Our partitioning subroutine stops both scans on equal keys.

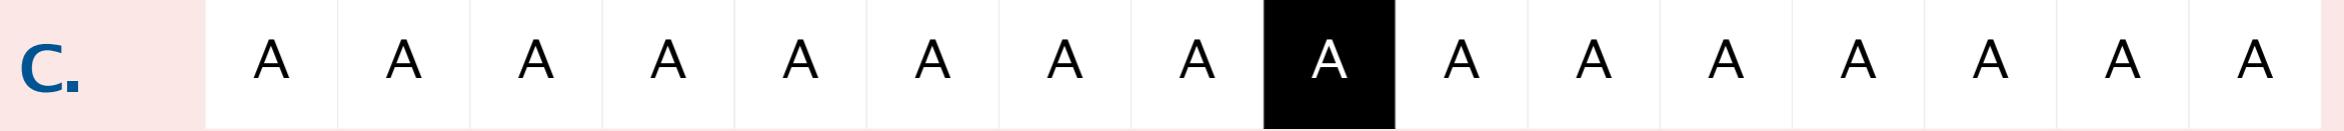

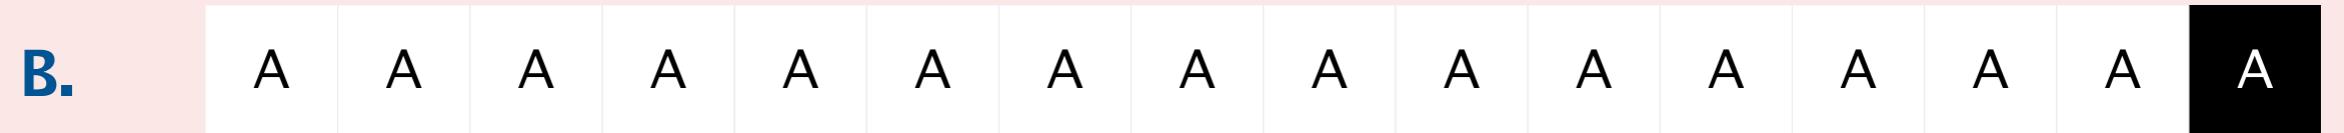

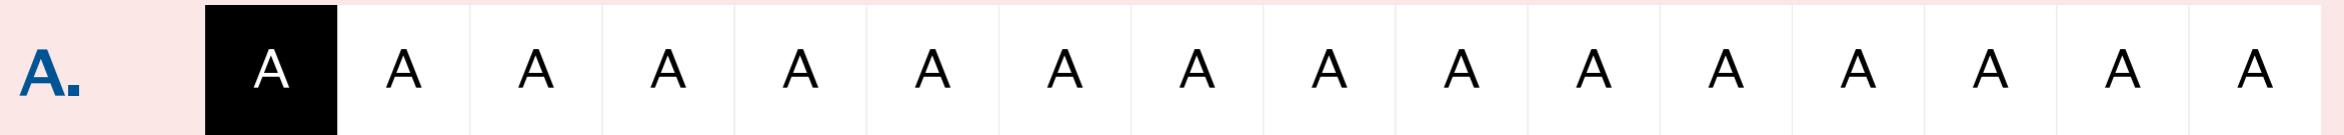

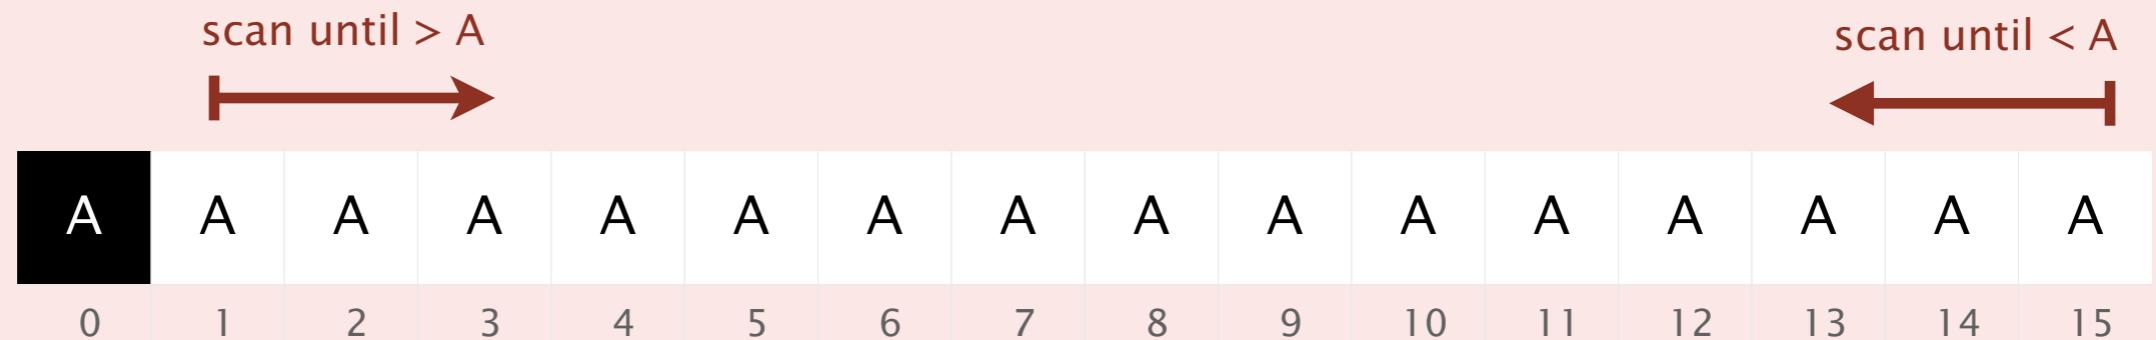

Q. Why not continue scans on equal keys?

## Quicksort quiz 2

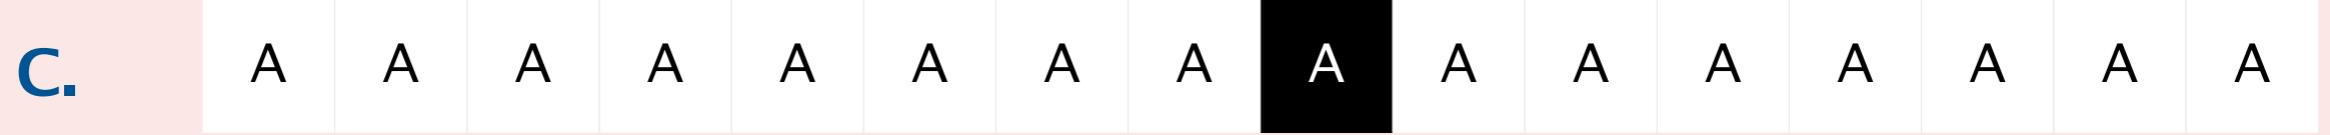

What is the result of partitioning the following array (skip over equal keys)?

D. *I don't know.*

## Quicksort quiz 3

What is the result of partitioning the following array (stop on equal keys)?

D. *I don't know.*

# DUTCH NATIONAL FLAG PROBLEM

**Problem.** [Edsger Dijkstra] Given an array of  $N$  buckets, each containing a red, white, or blue pebble, sort them by color.

**Operations allowed.**

- $swap(i, j)$ : swap the pebble in bucket  $i$  with the pebble in bucket  $j$ .
- $color(i)$ : color of pebble in bucket  $i$ .

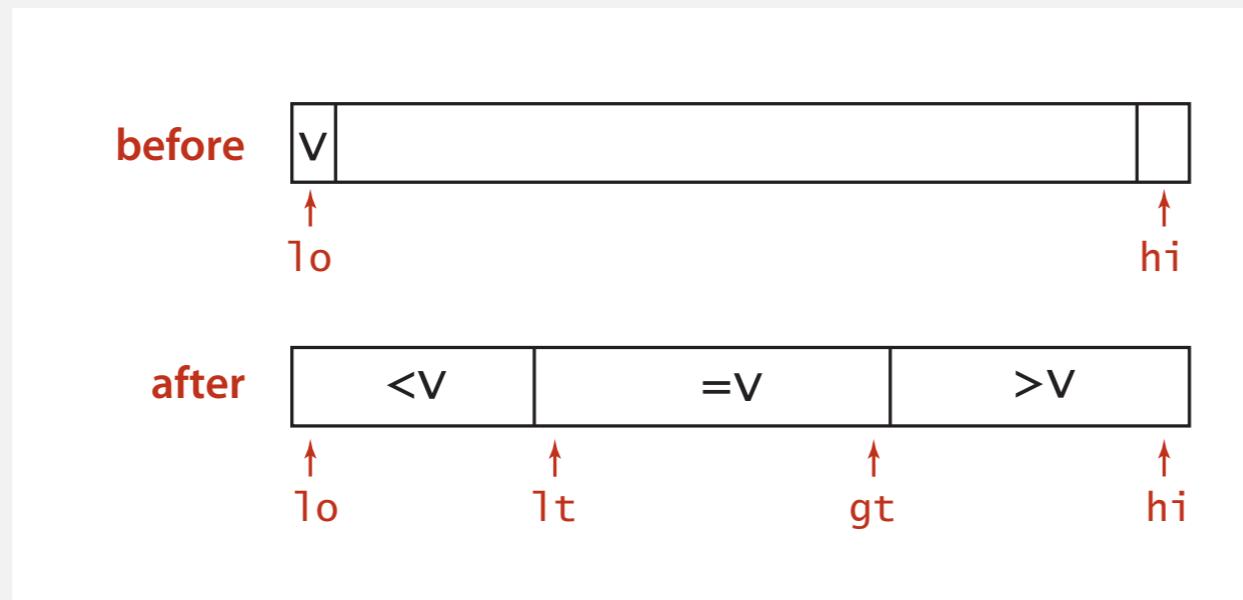

**Requirements.**

- Exactly  $N$  calls to  $color()$ .
- At most  $N$  calls to  $swap()$ .
- Constant extra space.

# 3-way partitioning

**Goal.** Partition array into **three** parts so that:

- Entries between  $l_t$  and  $g_t$  equal to the partition item.
- No larger entries to left of  $l_t$ .
- No smaller entries to right of  $g_t$ .

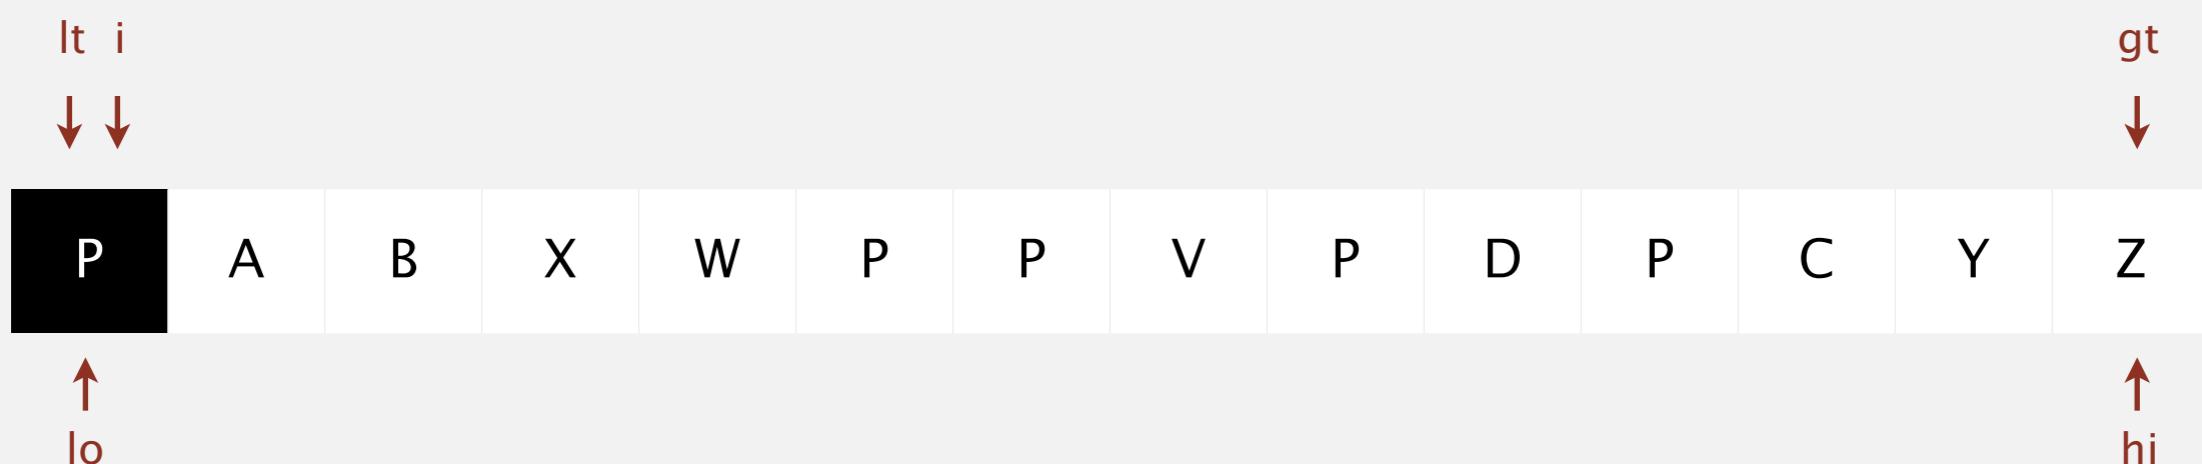

**Dutch national flag problem.** [Edsger Dijkstra]

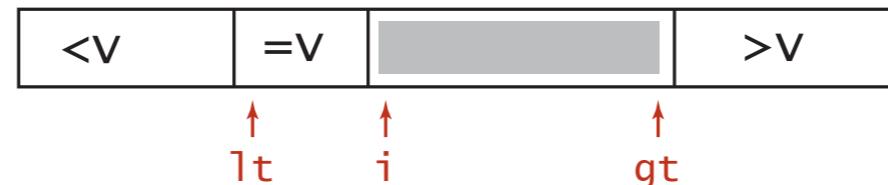

- Conventional wisdom until mid 1990s: not worth doing.
- Now incorporated into C library `qsort()` and Java 6 system sort.

# Dijkstra 3-way partitioning demo

- Let  $v$  be partitioning item  $a[lo]$ .
- Scan  $i$  from left to right.
  - $(a[i] < v)$ : exchange  $a[lt]$  with  $a[i]$ ; increment both  $lt$  and  $i$
  - $(a[i] > v)$ : exchange  $a[gt]$  with  $a[i]$ ; decrement  $gt$
  - $(a[i] == v)$ : increment  $i$

invariant

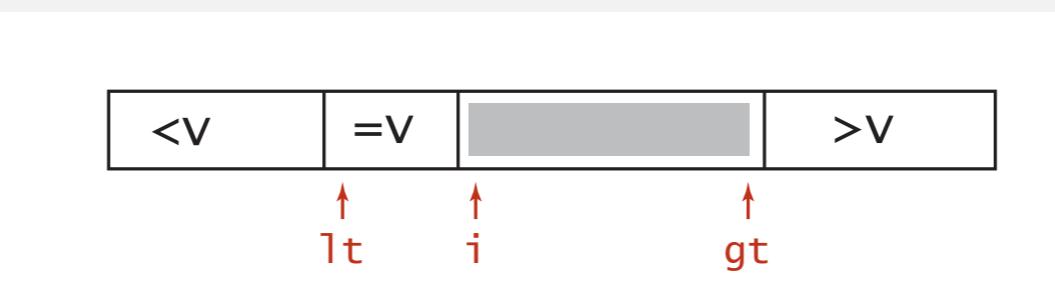

# Dijkstra 3-way partitioning demo

- Let  $v$  be partitioning item  $a[lo]$ .
- Scan  $i$  from left to right.
  - $(a[i] < v)$ : exchange  $a[lt]$  with  $a[i]$ ; increment both  $lt$  and  $i$
  - $(a[i] > v)$ : exchange  $a[gt]$  with  $a[i]$ ; decrement  $gt$
  - $(a[i] == v)$ : increment  $i$

invariant

3	8	7	B	B	B	<del>R</del>	W	W						

3-way partitioning trace (array contents after each loop iteration)

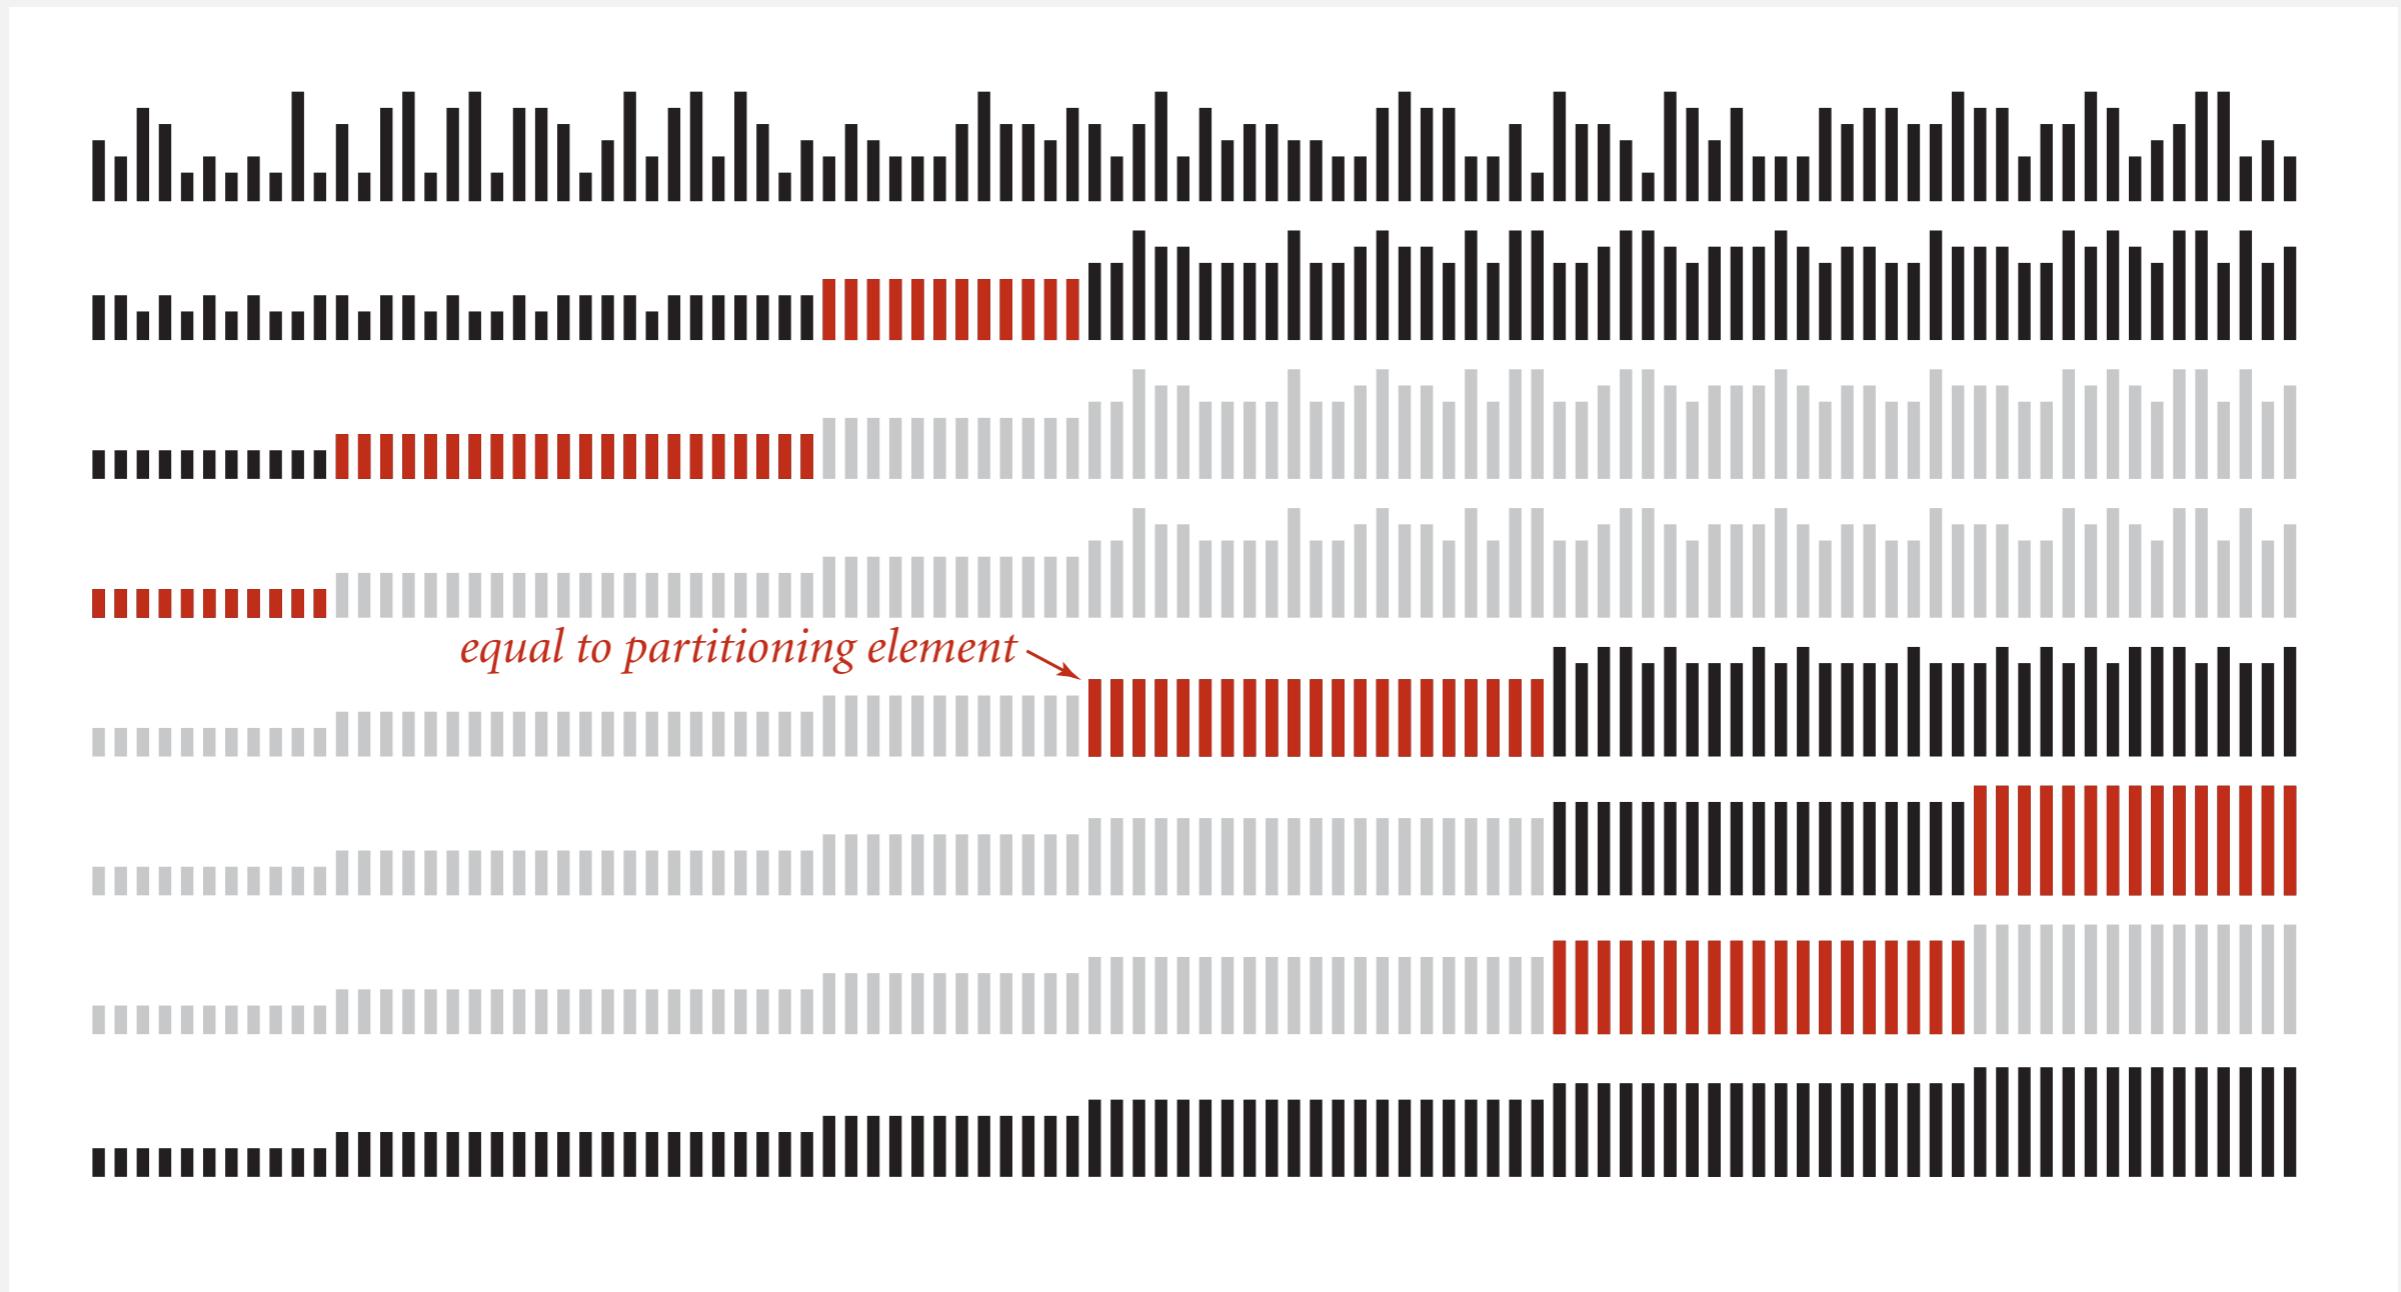

# 3-way quicksort: Java implementation

```
private static void sort(Comparable[] a, int lo, int hi)
{
    if (hi <= lo) return;
    int lt = lo, gt = hi;
    Comparable v = a[lo];
    int i = lo;
    while (i <= gt)
    {
        int cmp = a[i].compareTo(v);
        if      (cmp < 0) exch(a, lt++, i++);
        else if (cmp > 0) exch(a, i, gt--);
        else                  i++;
    }
    sort(a, lo, lt - 1);
    sort(a, gt + 1, hi);
}
```

## 3-way quicksort: visual trace

---

## Duplicate keys: lower bound

---

**Sorting lower bound.** If there are  $n$  distinct keys and the  $i^{th}$  one occurs  $x_i$  times, any compare-based sorting algorithm must use at least

$$\lg \left( \frac{N!}{x_1! x_2! \cdots x_n!} \right) \sim - \sum_{i=1}^n x_i \lg \frac{x_i}{N}$$

$N \lg N$  when all distinct;  
linear when only a constant number of distinct keys

compares in the worst case.

**Proposition.** [Sedgewick-Bentley 1997]

Quicksort with 3-way partitioning is **entropy-optimal**.

**Pf.** [beyond scope of course]

**Bottom line.** Quicksort with 3-way partitioning reduces running time from linearithmic to linear in broad class of applications.

# Sorting summary

---

	inplace?	stable?	best	average	worst	remarks
selection	✓		$\frac{1}{2} N^2$	$\frac{1}{2} N^2$	$\frac{1}{2} N^2$	$N$ exchanges

## 2.3 QUICKSORT

---

- ▶ *quicksort*
- ▶ *selection*
- ▶ *duplicate keys*
- ▶ ***system sorts***

# Sorting applications

---

Sorting algorithms are essential in a broad variety of applications:

- Sort a list of names.
  - Organize an MP3 library.
  - Display Google PageRank results.
  - List RSS feed in reverse chronological order.
  - Find the median.
  - Identify statistical outliers.
  - Binary search in a database.
  - Find duplicates in a mailing list.
  - Data compression.
  - Computer graphics.
  - Computational biology.
  - Load balancing on a parallel computer.
- ...  
obvious applications  
problems become easy once items  
are in sorted order  
non-obvious applications

## War story (system sort in C)

---

A beautiful bug report. [Allan Wilks and Rick Becker, 1991]

We found that qsort is unbearably slow on "organ-pipe" inputs like "01233210":

```
main (int argc, char**argv) {
    int n = atoi(argv[1]), i, x[100000];
    for (i = 0; i < n; i++)
        x[i] = i;
    for ( ; i < 2*n; i++)
        x[i] = 2*n-i-1;
    qsort(x, 2*n, sizeof(int), intcmp);
}
```

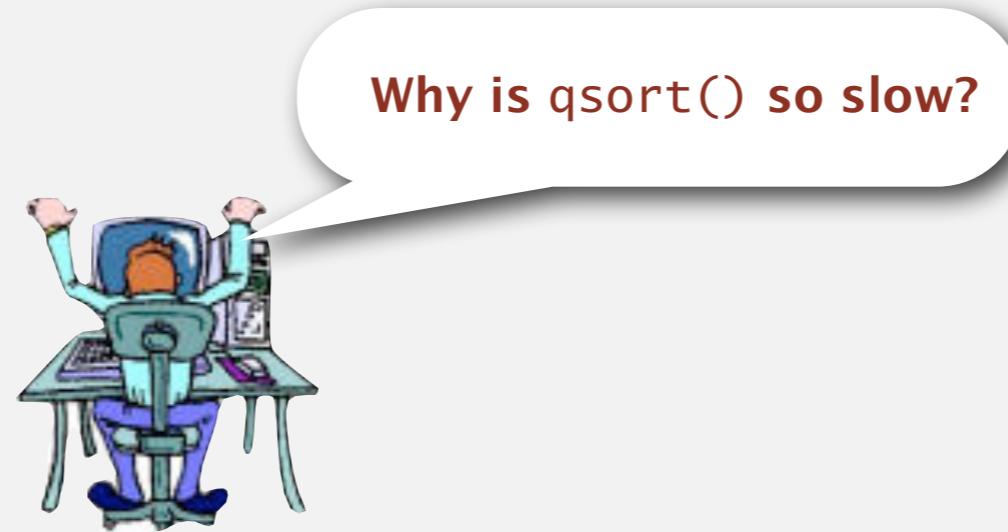

Here are the timings on our machine:

```
$ time a.out 2000
real    5.85s
$ time a.out 4000
real   21.64s
$time a.out 8000
real   85.11s
```

## War story (system sort in C)

---

Bug. A qsort() call that should have taken seconds was taking minutes.

At the time, almost all qsort() implementations based on those in:

- Version 7 Unix (1979): quadratic time to sort organ-pipe arrays.
- BSD Unix (1983): quadratic time to sort random arrays of 0s and 1s.

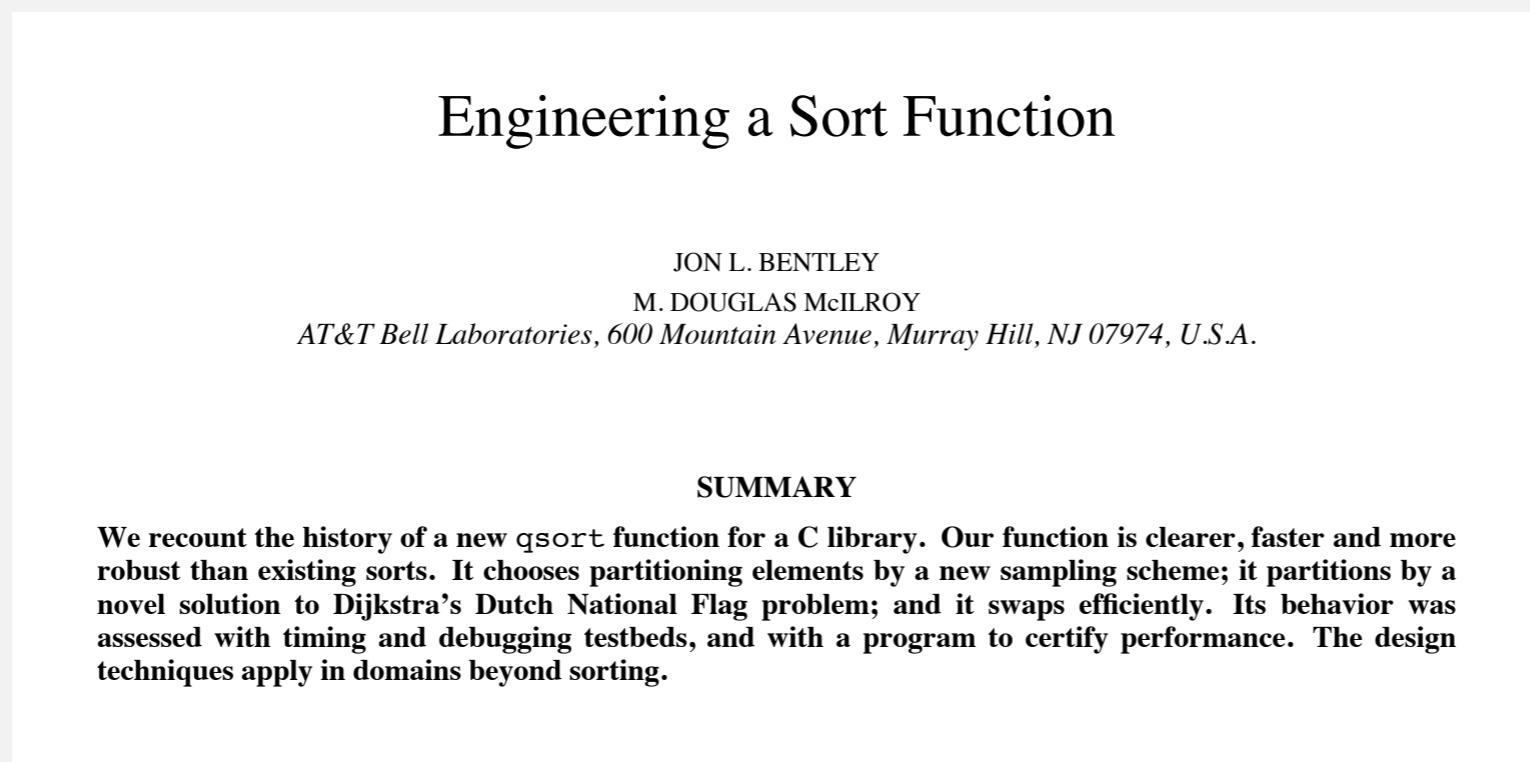

# Engineering a system sort (in 1993)

## Bentley-McIlroy quicksort.

- Cutoff to insertion sort for small subarrays.
- Partitioning item: median of 3 or Tukey's ninther.
- Partitioning scheme: Bentley-McIlroy 3-way partitioning.

*samples 9 items*  
similar to Dijkstra 3-way partitioning  
(but fewer exchanges when not many equal keys)

Very widely used. C, C++, Java 6, ....

# A beautiful mailing list post (Yaroslavskiy, September 2009)

## Replacement of quicksort in java.util.Arrays with new dual-pivot quicksort

Hello All,

I'd like to share with you new **Dual-Pivot Quicksort** which is faster than the known implementations (theoretically and experimental). I'd like to propose to replace the JDK's Quicksort implementation by new one.

...

The new Dual-Pivot Quicksort uses **\*two\*** pivots elements in this manner:

1. Pick an elements P1, P2, called pivots from the array.
2. Assume that P1 <= P2, otherwise swap it.
3. Reorder the array into three parts: those less than the smaller pivot, those larger than the larger pivot, and in between are those elements between (or equal to) the two pivots.
4. Recursively sort the sub-arrays.

The invariant of the Dual-Pivot Quicksort is:

[ < P1 | P1 <= & <= P2 } > P2 ]

...

## Dual-pivot quicksort

---

Use **two** partitioning items  $p_1$  and  $p_2$  and partition into three subarrays:

- Keys less than  $p_1$ .
- Keys between  $p_1$  and  $p_2$ .
- Keys greater than  $p_2$ .

Recursively sort three subarrays.

Note. Skip middle subarray if  $p_1 = p_2$ .

degenerates to Dijkstra's 3-way partitioning

A red arrow points from the text "degenerates to Dijkstra's 3-way partitioning" to the condition "Note. Skip middle subarray if  $p_1 = p_2$ ".

# Dual-pivot partitioning demo

---

## Initialization.

- Choose  $a[lo]$  and  $a[hi]$  as partitioning items.
- Exchange if necessary to ensure  $a[lo] \leq a[hi]$ .

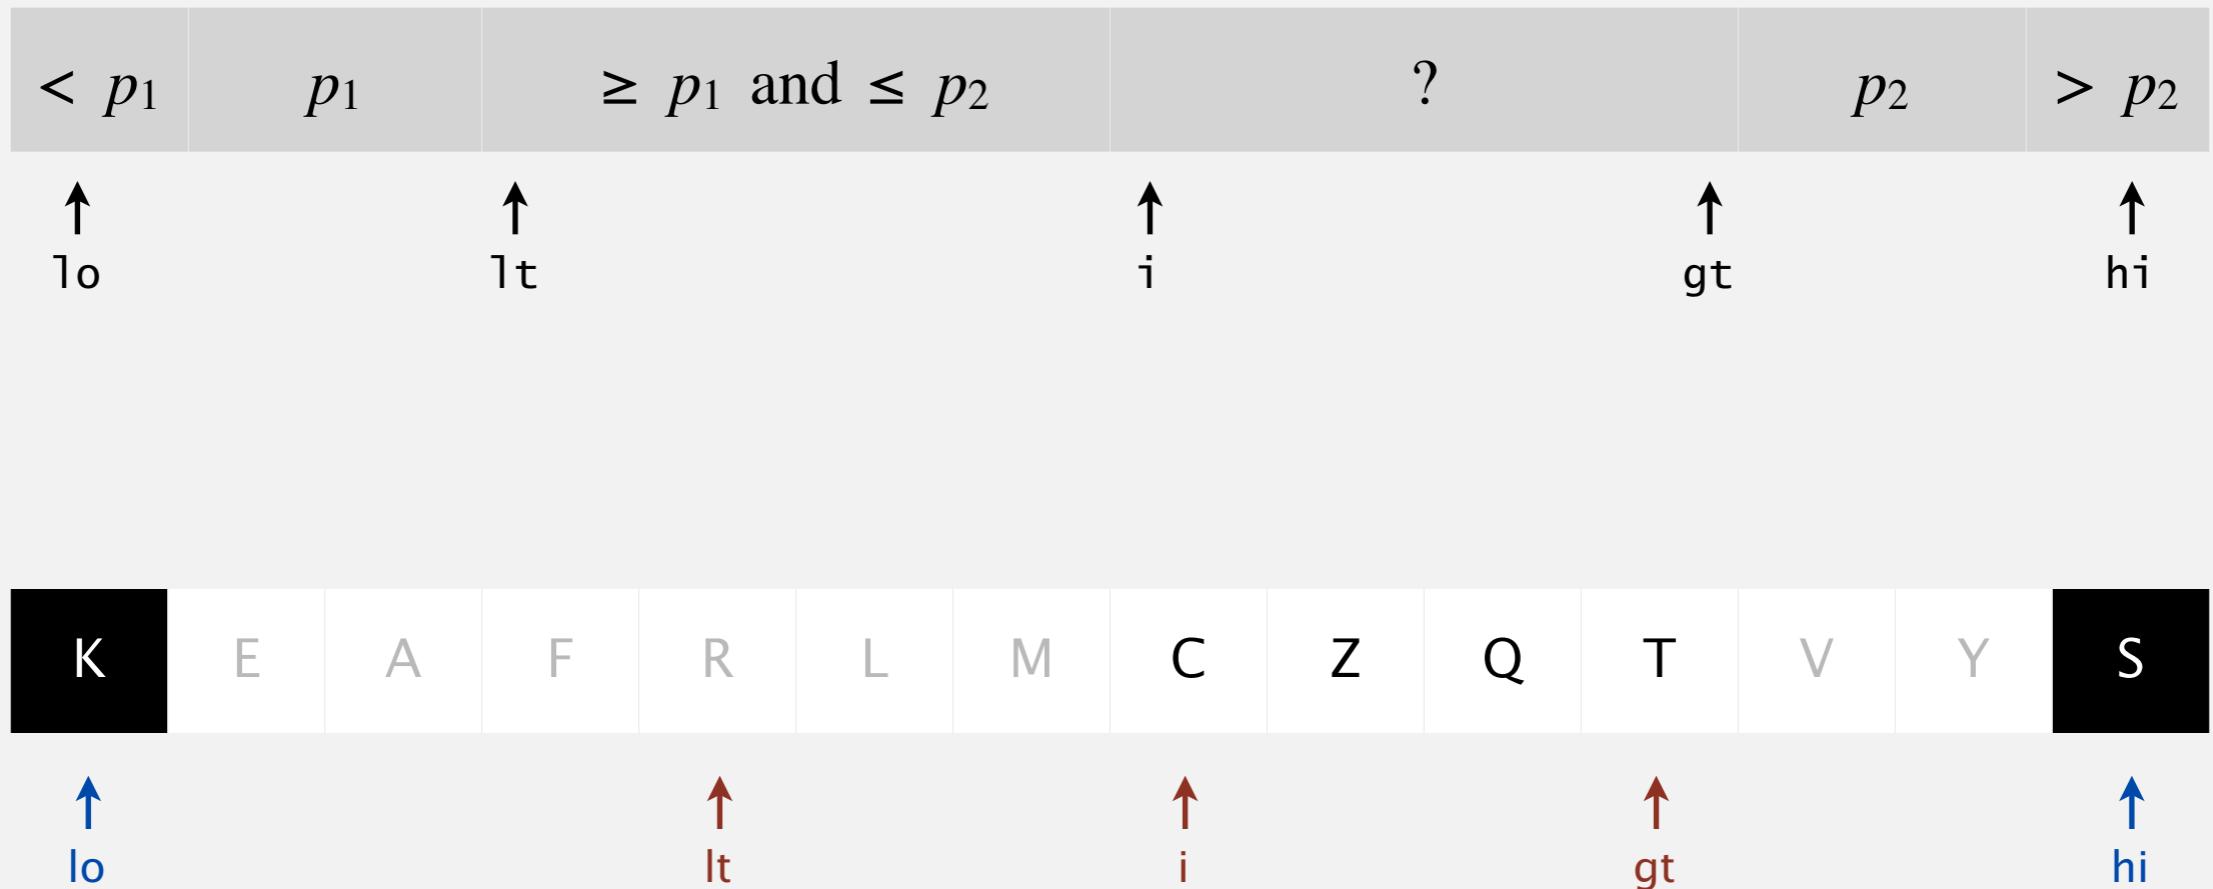

**exchange  $a[lo]$  and  $a[hi]$**

# Dual-pivot partitioning demo

Main loop. Repeat until  $i$  and  $gt$  pointers cross.

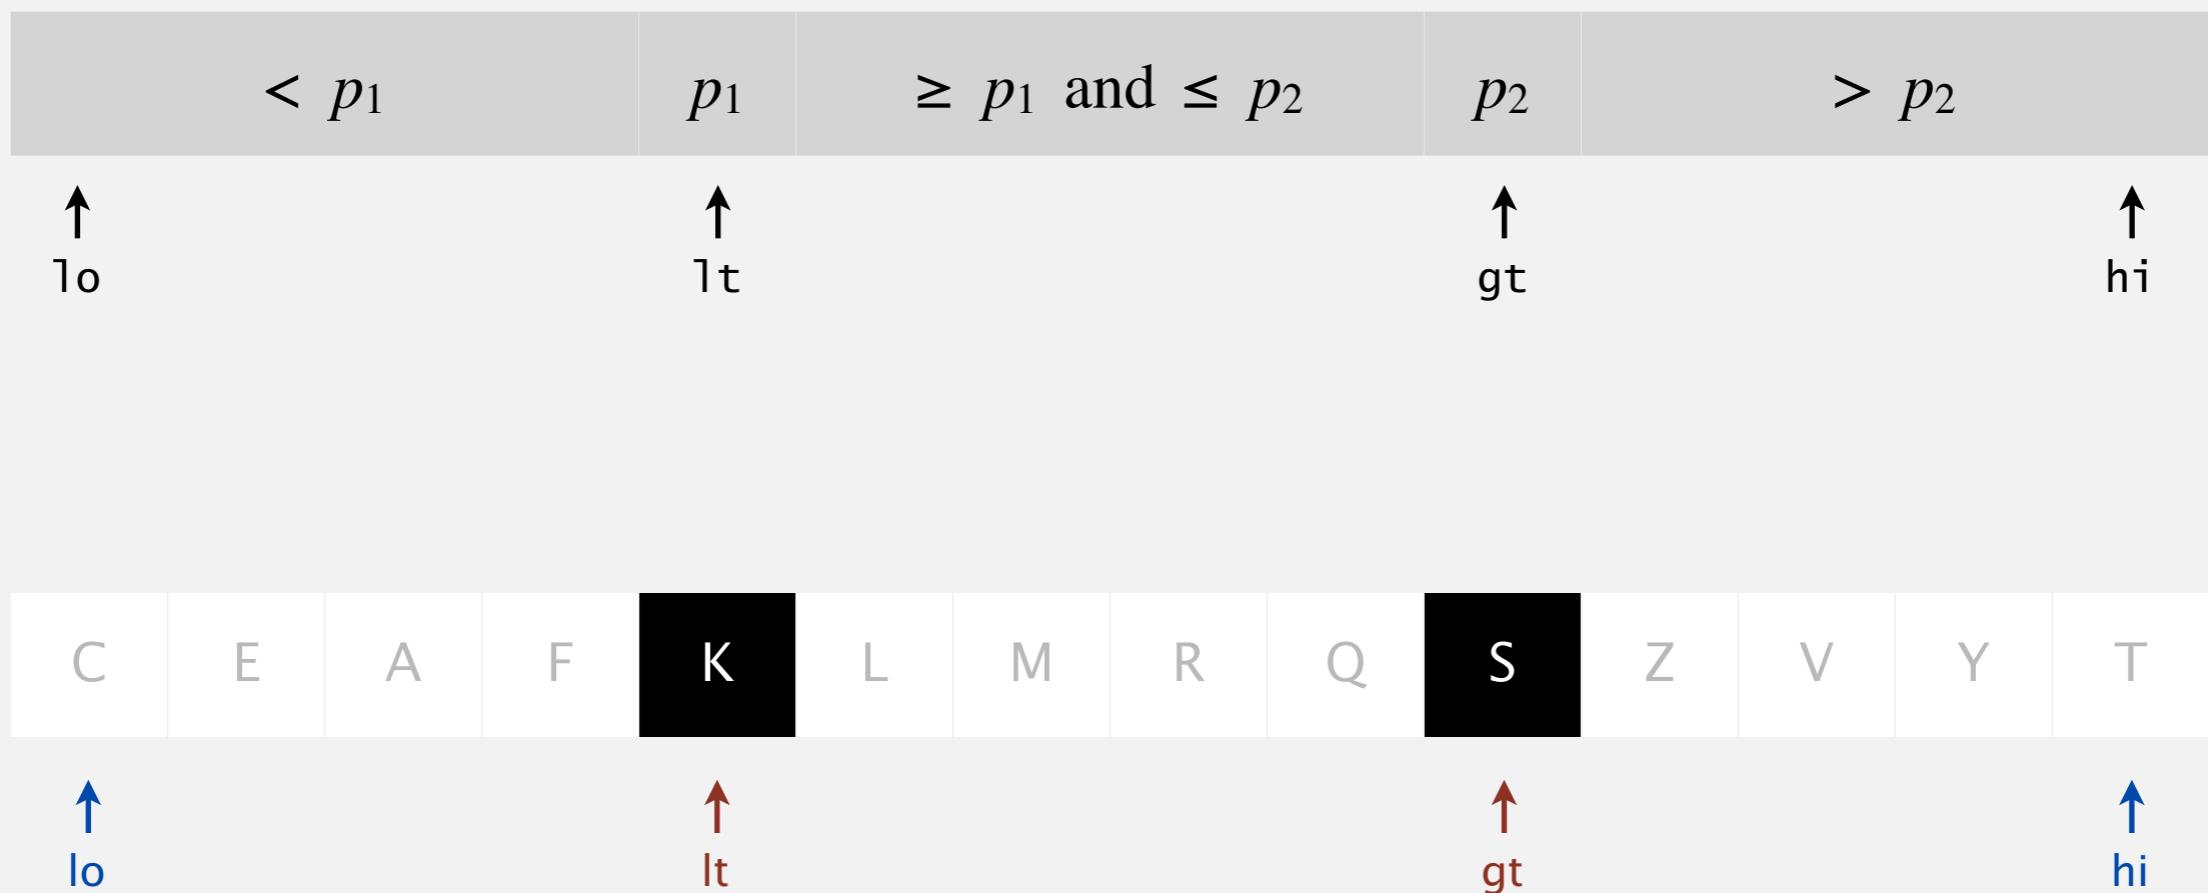

- If  $(a[i] < a[lo])$ , exchange  $a[i]$  with  $a[lt]$  and increment  $lt$  and  $i$ .
- Else if  $(a[i] > a[hi])$ , exchange  $a[i]$  with  $a[gt]$  and decrement  $gt$ .
- Else, increment  $i$ .

# Dual-pivot partitioning demo

Finalize.

- Exchange  $a[lo]$  with  $a[--lt]$ .
- Exchange  $a[hi]$  with  $a[++gt]$ .

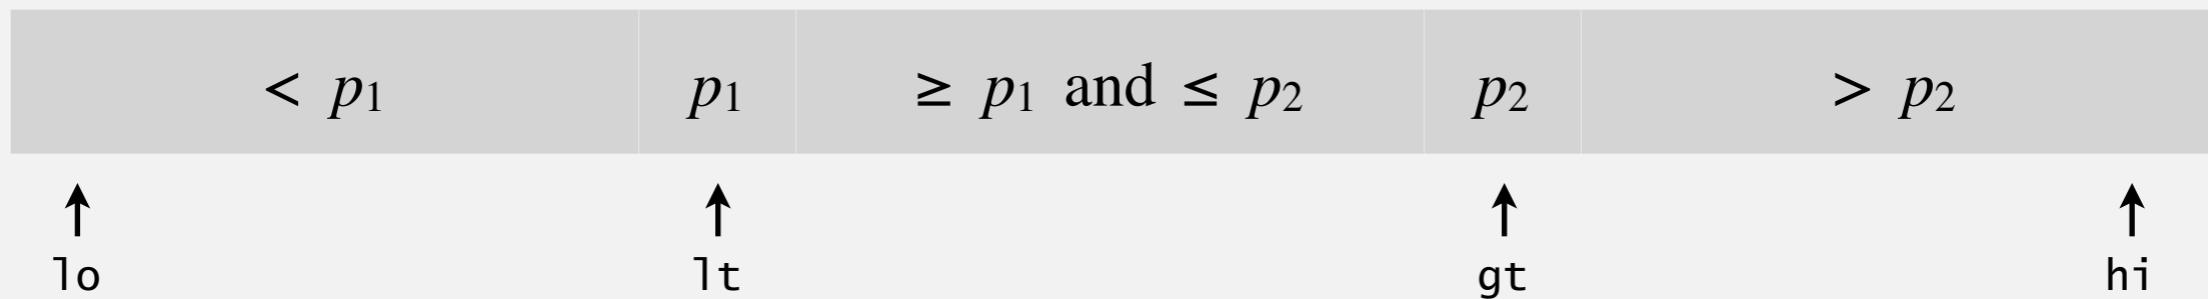

3-way partitioned

## Dual-pivot quicksort

---

Use **two** partitioning items  $p_1$  and  $p_2$  and partition into three subarrays:

- Keys less than  $p_1$ .
- Keys between  $p_1$  and  $p_2$ .
- Keys greater than  $p_2$ .

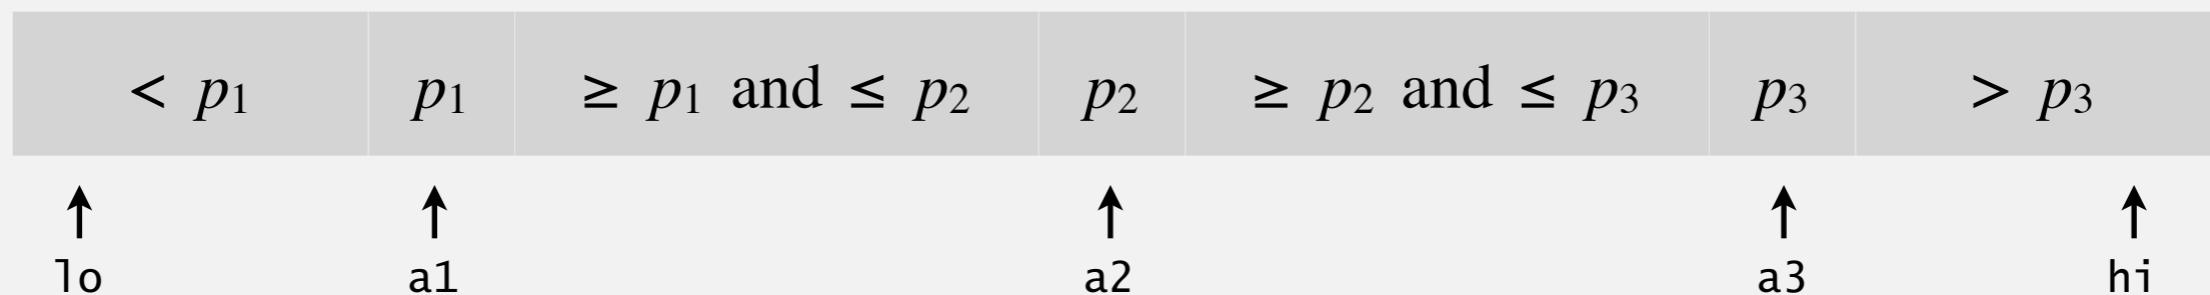

Now widely used. Java 7, Python unstable sort, Android, ...

# Three-pivot quicksort

Use **three** partitioning items  $p_1$ ,  $p_2$ , and  $p_3$  and partition into four subarrays:

- Keys less than  $p_1$ .
- Keys between  $p_1$  and  $p_2$ .
- Keys between  $p_2$  and  $p_3$ .
- Keys greater than  $p_3$ .

## Quicksort quiz 4

---

Why do 2-pivot (and 3-pivot) quicksort perform better than 1-pivot?

- A. Fewer compares.
- B. Fewer exchanges.
- C. Fewer cache misses.
- D. *I don't know.*

## Quicksort quiz 4

Why do 2-pivot (and 3-pivot) quicksort perform better than 1-pivot?

A. ~~Fewer compares.~~

B. ~~Fewer exchanges.~~

C. Fewer cache misses.

# entries scanned is a good proxy  
for cache performance when  
comparing quicksort variants

partitioning	compares	exchanges	entries scanned
1-pivot	$2 N \ln N$	$0.333 N \ln N$	$2 N \ln N$
median-of-3	$1.714 N \ln N$	$0.343 N \ln N$	$1.714 N \ln N$
2-pivot	$1.9 N \ln N$	$0.6 N \ln N$	$1.6 N \ln N$
3-pivot	$1.846 N \ln N$	$0.616 N \ln N$	$1.385 N \ln N$

Reference: Analysis of Pivot Sampling in Dual-Pivot Quicksort by Wild–Nebel–Martínez

Bottom line. Caching can have a significant impact on performance.

beyond scope of this course
